(54) METHOD FOR IDENTIFYING PEPTIDE ORIGINATED BY AMINO END OF AMINO
END MODIFYING PROTEIN

(57)Abstract:

PROBLEM TO BE SOLVED: To identify a peptide originated with amino end (N end) simply even small sample, by selectively modifying an N end-amino group of the peptide obtained by fragmenting protein modified at the N end.

SOLUTION: N end α -amino group of a peptide obtained by fragmenting protein modified at its N end is selectively modified. A mass of the peptide after the treatment is analyzed by a mass analysis, the peptide in which its mass change is not detected is identified, and can be identified to be a peptide originated with the N end of the N end modified protein. The peptide originated with the N end of the N end modified protein thus identified is provided, for example, for a tandem mass spectrometry, and hence a modified group of the N end can be identified, and an amino array decision is performed. Even the peptide generated by segmenting the N end modified protein and separated by a reversed-phase chromatography can be identified by the similar method.
